

ABSTRACT

A clip is provided for holding a stack of trays and a tray cover. The clip has a base having a width providing clearance for a width of a tray and a cut-away relief area for finger access. First and second opposing resilient side walls and a resilient back wall extend upward from the base, forming a structure with an open front and top. First and second resilient, elongated and downwardly curved members are included, each having a proximal end attached to an upper front of a corresponding side wall, and a distal end attached to the back wall. The resilient members are positioned so as to apply pressure to first and second opposing perimeter portions of a tray placed in the clip.
